

Description

The DGD2136 is a three-phase gate driver IC designed for high-voltage / high-speed applications, driving N-Channel MOSFETs and IGBTs in a half-bridge configuration. High-voltage processing techniques enable the DGD2136's high-side to switch to 600V in a bootstrap operation.

The DGD2136 logic inputs are compatible with standard TTL and CMOS levels (down to 3.3V) for easy interfacing with controlling devices and are enabled low to better function in high noise environments. The driver outputs feature high-pulse current buffers designed for minimum driver cross conduction.

The DGD2136 offers numerous protection functions. A shoot-through protection logic prevents both outputs from being high when both inputs are high (fault state), an undervoltage lockout for VCC shuts down the respective high side output. An overcurrent protection will terminate the six outputs. Both the VCC UVLO and the overcurrent protection trip an automatic fault clear with a timing that is adjustable with an external capacitor.

The DGD2136 is offered in SO-28 (Type TH) package and the operating temperature extends from -40°C to +125°C.

Applications

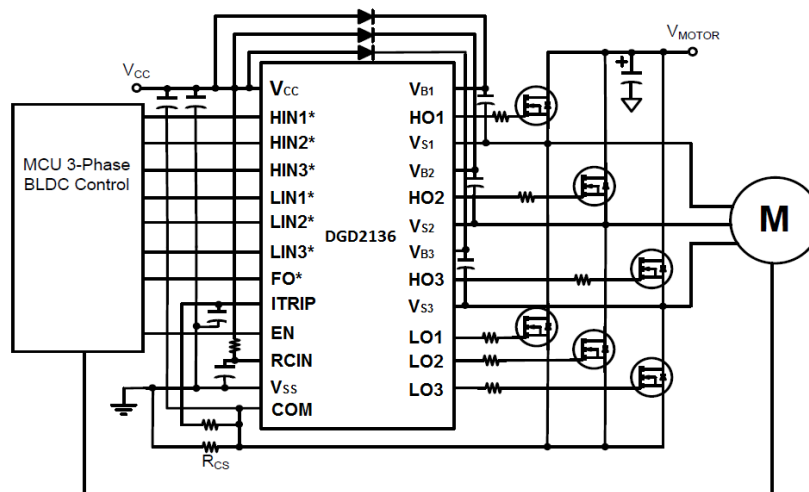

- 3-Phase Motor Inverter Driver
- White Goods – Air Conditioner, Washing Machine, Refrigerator
- Industrial Motor Inverter – Power Tools, Robotics
- General Purpose 3-Phase Inverter

Features

- Three Floating High-Side Drivers in Bootstrap Operation to 600V
- 200mA Source / 350mA Sink Output Current Capability
- Outputs Tolerant to Negative Transients, dV/dt Immune
- Logic Input 3.3V Capability
- Internal Deadtime of 290ns to Protect MOSFETs
- Matched Prop Delay for All Channels
- Outputs Out of Phase with Inputs
- Schmitt Triggered Logic Inputs
- Cross Conduction Prevention Logic
- Undervoltage Lockout for All Channels
- Overcurrent Protection Shuts Down Drivers
- Extended Temperature Range: -40°C to +125°C
- **Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)**
- **Halogen and Antimony Free. "Green" Device (Note 3)**

Mechanical Data

- Case: SO-28
- Case Material: Molded Plastic. "Green" Molding Compound.
- UL Flammability Classification Rating 94V-0
- Moisture Sensitivity: Level 3 per J-STD-020
- Terminals: Finish – Matte Tin Plated Leads, Solderable per MIL-STD-202, Method 208 
- Weight: 0.250 grams (Approximate)

Typical Configuration

SO-28 (Type TH)

Pin Descriptions

Pin Number	Pin Name	Function
1	V _{CC}	Low-Side and Logic Fixed Supply
2,3,4	HIN1*,HIN2*,HIN3*	Logic Input for High-Side Gate Driver Output, Out of Phase with HO
5,6,7	LIN1*,LIN2*,LIN3*	Logic Input for Low-Side Gate Driver Output, Out of Phase with LO
8	FO*	Fault Output with Open Drain (Fault with Overcurrent and V _{CC} UVLO)
9	ITRIP	Analog Input for Overcurrent Shutdown
10	EN	Logic Input for Functionality, I/O Logic Functions when EN is High
11	RCIN	An External RC Network Input used to Define FAULT CLEAR Delay
12	V _{SS}	Logic Ground
13	COM	Low-Side Driver Return
14,15,16	LO3,LO2,LO1	Low-Side Gate Driver Output
17,21,25	NC	No Connection (No Internal Connection)
18,22,26	V _{S3} , V _{S2} , V _{S1}	High-Side Floating Supply Return
19,23,27	HO3,HO2,HO1	High-Side Gate Driver Output
20,24,28	V _{B3} , V _{B2} , V _{B1}	High-Side Floating Supply

Functional Block Diagram

Absolute Maximum Ratings (@T_A = +25°C, unless otherwise specified.)

Characteristic	Symbol	Value	Unit
High-Side Floating Supply Voltage	V _B	-0.3 to +624	V
High-Side Floating Supply Offset Voltage	V _S	V _B -24 to V _B +0.3	V
High-Side Floating Output Voltage	V _{HO}	V _S -0.3 to V _B +0.3	V
Low-Side Output Voltage	V _{LO}	-0.3 to V _{CC} +0.3	V
Offset Supply Voltage Transient	dV _S / dt	50	V/ns
Low-Side Fixed Supply Voltage	V _{CC}	-0.3 to +24	V
Logic Input Voltage (HIN*, LIN*, ITRIP, EN and FO*)	V _{IN}	-0.3 to +5.5	V

Thermal Characteristics (@T_A = +25°C, unless otherwise specified.)

Characteristic	Symbol	Value	Unit
Power Dissipation Linear derating factor (Note 5)	P _D	2.3	W
Thermal Resistance, Junction to Ambient (Note 5)	R _{θJA}	60	°C/W
Thermal Resistance, Junction to Case (Note 5)	R _{θJC}	45	°C/W
Operating Temperature	T _J	+150	°C
Lead Temperature (Soldering, 10s)	T _L	+300	
Storage Temperature Range	T _{STG}	-55 to +150	

Note: 5. When mounted on a standard JEDEC 2-layer FR-4 board.

Recommended Operating Conditions

Parameter	Symbol	Min	Max	Unit
High-Side Floating Supply Absolute Voltage	V _B	V _S + 10	V _S + 20	V
High-Side Floating Supply Offset Voltage	V _S	(Note 6)	600	V
High-Side Floating Output Voltage	V _{HO}	V _S	V _B	V
Low-Side Fixed Supply Voltage	V _{CC}	10	20	V
Low-Side Output Voltage	V _{LO}	COM	V _{CC}	V
Logic Input Voltage (HIN*, LIN*, ITRIP & EN)	V _{IN}	V _{SS}	5	V
Fault Output Voltage	V _{FO}	V _{SS}	V _{CC}	V
Logic Ground	V _{SS}	-5	5	V
Ambient Temperature	T _A	-40	+125	°C

Note: 6. Logic operation for V_S of -5V to +600V. Logic state held for V_S of -5V to -V_{BS}.

DC Electrical Characteristics

(V_{BIAS} (V_{CC} , V_{BS}) = 15V, @ T_A = +25°C, unless otherwise specified.) (Note 7)

Parameter	Symbol	Min	Typ	Max	Unit	Condition
Logic "0" Input Voltage	V_{IH}	2.4	–	–	V	–
Logic "1" Input Voltage	V_{IL}	–	–	0.8	V	–
High Level Output Voltage, $V_{BIAS} - V_O$	V_{OH}	–	–	0.1	V	$I_O = 0mA$
Low Level Output Voltage, V_O	V_{OL}	–	–	0.1	V	$I_O = 0mA$
Offset Supply Leakage Current	I_{LK}	–	–	10	μA	$V_B = V_S = 600V$
Quiescent V_{BS} Supply Current	I_{BSQ}	10	85	130	μA	$V_{IN} = 0V$ or $5V$, $EN = 0V$
Quiescent V_{CC} Supply Current	I_{CCQ}	–	1.1	1.6	mA	$V_{IN} = 0V$ or $5V$, $EN = 0V$
Logic Input Bias Current (HO=LO=HIGH)	I_{IN+}	–	130	200	μA	$V_{IN} = 0V$
Logic Input Bias Current (HO=LO=LOW)	I_{IN-}	–	3.0	20	μA	$V_{IN} = 5V$
Logic Enable "1" Input Bias Current	I_{EN+}	–	33	80	μA	$V_{EN} = 5V$
Logic Enable "0" Input Bias Current	I_{EN-}	–	–	2.0	μA	$V_{EN} = 0V$
V_{BS} Supply Undervoltage Positive Going Threshold	V_{BSUV+}	7.6	8.9	9.9	V	–
V_{BS} Supply Undervoltage Negative Going Threshold	V_{BSUV-}	7.1	8.3	9.4	V	–
V_{CC} Supply Undervoltage Positive Going Threshold	V_{CCUV+}	7.6	8.9	9.9	V	–
V_{CC} Supply Undervoltage Negative Going Threshold	V_{CCUV-}	7.1	8.3	9.4	V	–
Output High Short Circuit Pulsed Current	I_{O+}	120	200	–	mA	$V_O = 0V$, $PW \leq 10\mu s$
Output Low Short Circuit Pulsed Current	I_{O-}	250	350	–	mA	$V_O = 15V$, $PW \leq 10\mu s$
Overcurrent Detect Positive Threshold	V_{ITH+}	400	500	600	mV	–
Overcurrent Detect Negative Threshold	V_{ITH-}	340	420	500	mV	–
Short-Circuit Input Current	I_{CSIN}	6.0	11	16	μA	$V_{CSIN} = 1V$
RCIN Positive Going Threshold Voltage	V_{RCINT+}	7.0	8.4	9.8	V	–
RCIN Negative Going Threshold Voltage	V_{RCINT-}	–	5.0	–	V	–
Fault Output Low Level Voltage	V_{FOL}	–	0.2	0.5	V	$V_{CS} = 1V$, $I_{FO} = 1.5mA$
RCIN on Resistance	R_{DSRCIN}	40	75	110	Ω	$I_{RCIN} = 1.5mA$
Fault Output on Resistance	R_{DSFO}	80	130	180	Ω	$I_{FO} = 1.5mA$

Note: 7. The V_{IN} , V_{TH} and I_{IN} parameters are referenced to V_{SS} and are applicable to all six channels (HIN1*, 2*, 3* and LIN1*, 2*, 3*). The V_O and I_O parameters are applicable to the output pins (HO1, 2, 3 and LO1, 2, 3) and are referenced to COM.

AC Electrical Characteristics

(V_{BIAS} (V_{CC} , V_{BS}) = 15V, $C_L = 1000pF$, @ T_A = +25°C, unless otherwise specified.)

Parameter	Symbol	Min	Typ	Max	Unit	Condition
Turn-On Propagation Delay	t_{ON}	200	330	460	ns	$V_S = 0V$
Turn-Off Propagation Delay	t_{OFF}	200	330	460	ns	$V_S = 0V$
Turn-On Rise Time	t_R	–	90	150	ns	$V_S = 0V$
Turn-Off Fall Time	t_F	–	35	60	ns	$V_S = 0V$
Delay Matching	t_{DM}	–	–	50	ns	–
Enable Low to Output Shutdown Delay	t_{EN}	225	300	425	ns	–
ITRIP Pin Leading-Edge Blanking Time	t_{BLT}	200	300	400	ns	–
Time from ITRIP Triggering to FO*	t_{FLT}	360	550	760	ns	From $V_{ITRIP} = 1V$ to FO* turn off
Time from ITRIP Triggering to All Gate Outputs Turn Off	t_{ITRIP}	420	615	820	ns	From $V_{ITRIP} = 1V$ to starting gate turn off
Input Filtering Time (HIN*, LIN*, EN)	t_{FLTIN}	–	250	–	ns	–
Fault Clear Time	t_{FLTCLR}	–	1.6	–	ms	$C_{RCIN} = 1nF$, $R_{RCIN} = 2M\Omega$
Deadtime	t_{DT}	200	290	420	ns	–
Deadtime Matching	t_{DTM}	–	–	50	ns	–
Output Pulse Width Matching (Note 8)	t_{PM}	–	50	75	ns	$PW_{IN} > 1\mu s$

Note: 8. t_{PM} is defined as $PW_{IN} - PW_{OUT}$.

Design Notes

Over the past decade, in white goods, there has been a transition from AC motors to brushless DC motors; correspondingly power switching is required to drive the BLDC motors. For even greater efficiency and cost reduction, 3-phase gate driver ICs are used to optimally drive MOSFETs and IGBTs. The DGD2136, 3-Phase Half-Bridge Gate Driver IC, is a good choice for 3-phase motor applications because of ease of design, reliability, and less space used than 3 x single channel gate driver ICs.

In the inductive 3-phase motor circuit environment, MOSFET/IGBT turn-on produces significant current spikes; and the currents are the highest and the system is the noisiest during startup. In certain applications, with significant noise on the ground lines of VSS-COM (for example during startup), the DGD2136 is susceptible to the noise and can enter fault condition. And if the fault is long enough, the MCU will detect the fault situation, disable inputs and turn off the system. In effect there is a stall at startup. Figure 27 and Figure 28 show startup in a 240V refrigerator compressor application (FO*-MCU (blue) - fault signal at MCU, COM-VSS (yellow) and VS (green) - motor voltage).

This Design Tip will provide two solutions, depending on the current sense circuit, to decrease the IC ground noise and ensure the DGD2136 does not enter fault condition and there is no stall at startup.

Figure 27. During startup when the current is high, COM-VSS noise is high (yellow), fault conditions occur (blue), compressor will eventually stall, 2ms/div

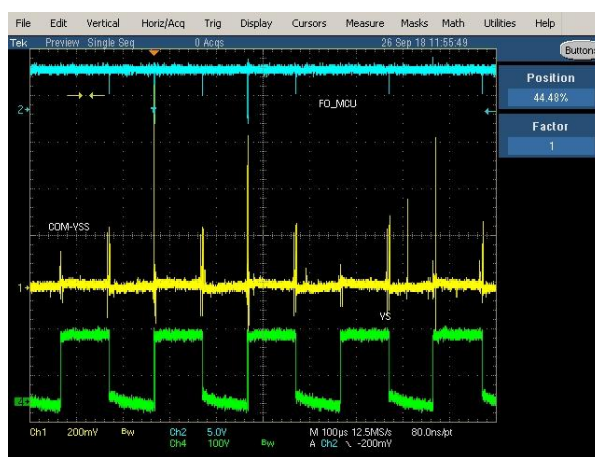

Figure 28. During startup, current is high, COM-VSS noise is high, fault conditions occur, compressor will eventually stall, 100us/div

Solution 1

If the 3 phase current sensing configuration is similar to Figure 29 or Figure 30, then the best solution is to short the line between VSS and COM directly at the IC. This provides a more stable ground at the IC, and the current sense circuit operates normally (see Figures 31 and 32).

Figure 29. Shorting VSS-COM at IC for current sense configuration A

Figure 30. Shorting VSS-COM at IC for current sense configuration B

Design Notes (Cont.)

Figure 31. During startup, current is high, with shorted COM-VSS, noise is less, fault conditions do not occur, compressor will not stall, 2ms/div

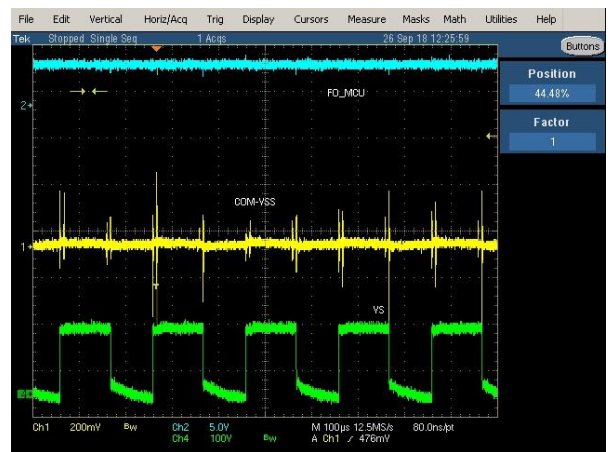

Figure 32. During startup, current is high, with shorted COM-VSS, noise is less, fault conditions do not occur, compressor will not stall, 100μs/div

Solution 2

If the 3-phase current sensing configuration is similar to Figure 33, then the best solution is to add a ceramic capacitor (0.022 to 0.1μF) between VSS and COM directly at the IC. This provides a more stable ground at the IC, and the current sense circuit operates normally (see Figures 34 and 35).

Figure 33. Adding capacitor between VSS-COM at IC for current sense configuration C

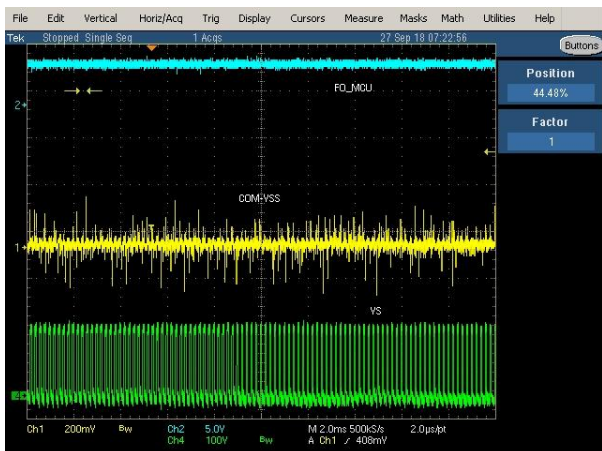

Figure 34. During startup current is high, with cap between COM-VSS, noise is less, fault conditions do not occur, compressor will not stall, 2ms/div

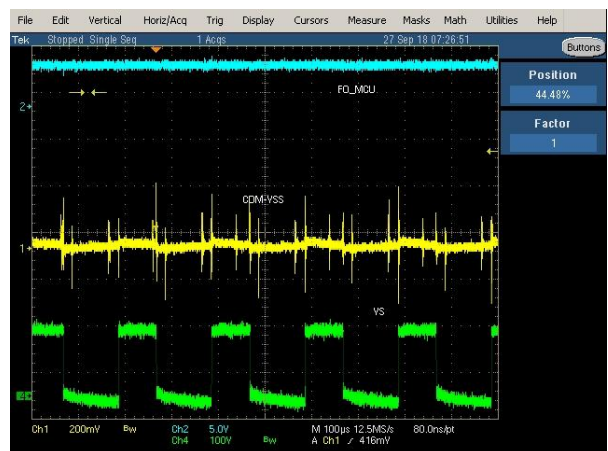

Figure 35. During startup current is high, with cap between COM-VSS, noise is less, fault conditions do not occur, compressor will not stall, 100μs/div

Summary

To improve the performance of the DGD2136 during high current operation of 3-phase motor applications, it is best to make a more stable IC ground. Depending on the current sense circuit arrangement in the 3-phase motor driver application, two solutions are provided: one that shorts the connection between COM-VSS and another is adding a ceramic capacitor between COM-VSS. In a compressor application, there were no fault conditions seen at the MCU and the COM-VSS noise was significantly less with the solutions provided.

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
